Title	Soil Landscapes of the Gosford-Lake Macquarie 1:100,000 Sheets
Abstract	This map is one of a series of soil landscape maps that are intended for all of central and eastern NSW, based on standard 1:100,000 and 1:250,000 topographic sheets. The map provides an inventory of soil and landscape properties of the area and identifies major soil and landscape qualities and constraints. It integrates soil and topographic features into single units with relatively uniform land management requirements. Soils are described in terms of soil materials in addition to the Great Soil Group and Northcote classification systems.
	Related Datasets: The dataset area is also covered by the mapping of the <u>Soil and</u> <u>Land Resources of the Hawkesbury-Nepean Catchment</u> and <u>Acid Sulphate Soil Risk</u> <u>Mapping</u> .
	Online Maps: This and related datasets can be viewed using <u>eSPADE</u> (NSW's soil spatial viewer), which contains a suite of soil and landscape information including soil profile data. Many of these datasets have hot-linked soil reports. An alternative viewer is the <u>SEED Map</u> ; an ideal way to see what other natural resources datasets (e.g. vegetation) are available for this map area.

Additional	GIS Field name descriptions	
information source	CODE - Soil landscape code NAME - Soil landscape name PROCESS - Process Group of the soil landscape. Groups are named after either recent or current land-forming processes, or conditions that influence soil parent material or soil type. Descriptions of these groups are available within soil landscape reports and on the DPIE website. LANDSCAPE - A string combining process group and the soil landscape code. The first two capital letters are the process groups abbreviation and the remaining letters are the soil landscape code. VERSION - Version number

Lineage	process responsible for the parent material. The bours stereoscopic interpretation 1:25,000 base maps. After soils, the provisional land soil landscapes are presend dominant geomorphic pr	es were established, based firstly on the dominant geomorphic he formation of the landscape and secondly, on the geological ndaries of these provisional soil landscapes were mapped using on of 1:40,000 black and white aerial photographs transferred onto er field checking these boundaries and detailed investigation of the scapes were confirmed, amalgamated or sub-divided. The resulting ented on the map at 1:100,000 scale in groups based on their ocess.
	more over the 32 soil lan information were recorde Information System (SAL	dscapes. At each described site, soil morphological data and site ed on Soil Data Cards and later transferred into the Soil and Land IS). Over 125 soil samples were collected for laboratory analysis.

Scope	dataset		
DQ Completeness Commission			
Effective date	2009-01-10		
Explanation	Each soil landscape generally has a representative profile (type profile) for each sub- landscape (facet) within it. Soil landscapes with difficult access may have very little to no soil profile descriptions. The number of soil profile descriptions and observations are within the recommended range specified in the Australian Soil and Land Survey Handbook (Reid 1988). Soil landscape polygons less than 40 hectares and elongated polygons less than 300 m wide are generally not shown unless they are unusually significant.		
DQ Completene	ess Omission		
Effective date	2009-01-10		
DQ Conceptual	Consistency		
Effective date	2009-01-10		
Explanation	The map and report have been checked for technical consistency and compliance with soil landscape map series standards. Map unit concepts and polygons, major soil types and soil landscape descriptions have been field verified (field edited) by a peer soil surveyor. Soil landscape boundaries have been checked and refined using iterative field and aerial photo checks. Logical consistency of vector data was assessed at the time of map digitisation.		
DQ Topological	Consistency		
Effective date	1900-01-01		
Explanation	ArcGIS was used to ensure all polygons in the shapefile are topologically correct.		
DQ Absolute Ex	ternal Positional Accuracy		
Effective date	2009-01-10		
Explanation	Observations and soil profile numbers are located onto the field sheets in the field. Location is determined by map reading (with accuracy to 25m) and where this is not possible using Global Positioning Systems (with accuracy within 100m). Field sheets are digitised to 13m accuracy.		
DQ Non Quantit	tative Attribute Correctness		
Effective date	2009-01-10		
Explanation	Soil landscape map units are individualised by unique combinations of soil type, topography, geology, vegetation, land use existing erosion/land degradation and constraints to development. The land and soil attributes in this product were predominately assessed from field observations and aerial photo interpretation.		
	Soil laboratory tests are undertaken for at least one representative sample for each soil material. Where possible, the chemical test methods adopted are the same as those in Raymond and Higginson (1992). Single test results provided for each soil material are intended as a guide only and variation in physical and chemical properties within each soil material should be anticipated.		
	Soils were examined and described in in the field. At each site, soil morphological data and site information were recorded on Soil and Land Information System (SALIS) cards. Sufficient field work was undertaken within each soil landscape to identify the range of soils present and to enable their distribution within the landscape to be described.
