

Title	Vegetation & floristics of Boronga Nature Reserve, 2006. VIS_ID 4018
Alternative title(s)	BorongaNR_2006_E_4018
Abstract	<p>The vegetation & floristics of Boronga Nature Reserve is described and mapped (1:50 000). Six communities were mapped based on ground truthing, air photo interpretation and landform. One community is considered to be endangered and all others are considered to be poorly reserved and 'of concern'. Most communities are of woodland structure, though some sections are forests or derived shrubland and grasslands based on past clearing and selective logging practices. The communities show considerable variation and intergrade along common boundaries and in particular on intermediate soil types. In general the all six communities probably are representatives of assemblages more commonly found within central and western Queensland. The three reserves are dominated in general by <i>Callitris glaucophylla</i>, <i>Geijera parviflora</i> and <i>Eucalyptus populnea</i>. This project was commissioned by NPWS Western Branch Northern Plains Region (ROCU), Narrabri office. NPWS staff have undertaken ground truthing and ascertained that there are some inconsistencies between vegetation communities described and mapped in this report and vegetation types observable in Boomi, Boomi West and Boronga NRs. The observed discrepancies were not able to be rectified during the term of the contract. Please consider these inconsistencies when using the dataset for undertaking reserve-scale operational, planning or environmental assessment activities on NPWS-managed reserves. Vegetation types have been classified into broader groups according to dominant species, structure, soil type and landscape position. VIS_ID 4018</p>

Lineage Linework depicting an observed or inferred vegetation type boundary was marked on aerial photograph acetate overlays during stereoscopic interpretation of colour aerial photography at 1:50, 000 scale.

Each mapped polygon was assigned to a pre-determined vegetation type (see abstract for vegetation classification details), which was marked on the overlay. Linework was transferred to hardcopy topographic mapsheets, scanned and the images georectified in ArcView 3.3 GIS to give a spatial reference.

Then the scanned image was used as a backdrop to digitise linework on-screen. The digital lines were converted to polygons and the shapefile cleaned to remove gaps, overlaps and wayward nodes. A code denoting the vegetation community was then attributed to each polygon based on the hardcopy linework.

NPWS staff have undertaken ground truthing and ascertained that there are some inconsistencies between vegetation communities described and mapped in this report and vegetation types observable in Boomi, Boomi West and Boronga NRs.

The observed discrepancies were not able to be rectified during the term of the contract. Please consider these inconsistencies when using the dataset for undertaking reserve-scale operational, planning or environmental assessment activities on NPWS-managed reserves.
