Title	NPWS WildCount Long-term Fauna Monitoring Species Data 2012-2021	
Alternative title(s)	WildCount Species Data	
Abstract	The aim of the Wildcount program is to monitor fauna in eastern New South Wales within NPWS estate and identify changes in species populations through Occupancy Modelling. Surveys commenced in 2012 and have been conducted every year since then. The first 10 years of field survey ends in 2021 and the program will be reviewed. They are conducted during Autumn. There are 200 sites with the average number of sites surveyed each year being 198. Within each site four Reconyx PC800 cameras were deployed and placed at the corners of a 500 x 500 metre grid. Lures consisting of peanut butter and oats are placed at each camera. Each site is surveyed for a minimum of 14 consecutive days. Species are recorded as either present or absent and are assigned a level of confidence (definite, probable, possible) as to their species identification.  Supporting Information: Website

WildCount: Broad-scale, long-	Name: WildCount: Broad-scale, long-term monitoring of fauna in NSW national parks 2012-2016	
term monitoring of fauna in NSW national parks 2012-2016	Protocol: WWW:DOWNLOAD-1.0-httpdownload	
	Description:	
	This report summarises the first five years of data collection and analysis, from 2012-2016. It addresses a number of key factors arising from the study thus far, (i) patterns of annual variation and change in occupancy (as a surrogate for change in distribution) of 39 of the most commonly encountered species or taxa, (ii) detectability of 157 species/taxa across approximately 200 study sites, and (iii) an assessment of the overall study design in delivering the stated aims of the study.
