

Title	Worimi Conservation Lands Vegetation 2010. VIS_ID 3903
Alternative title(s)	WorimiConsvnLands_2010_E_3903
Abstract	Vegetation community mapping for the Worimi Conservation Lands - Worimi National Park, Worimi State Conservation Area and Worimi Regional Park, by Stephen Bell and Colin Driscoll, 2010. A Hunter NPWS Region contract. The Worimi Conservation Lands have been identified as a significant cultural landscape and are managed through a board of management by registered Aboriginal Owners and the Department of Environment and Heritage. The area covers 4,200 hectares. This vegetation map supercedes the previous Stockton Bight vegetation mapping. VIS_ID 3903

Purpose	The following objectives have been identified as core components of the study;;1. Undertake a floristic survey of the Worimi Conservation lands (WCL) which identifies flora species;;vegetation communities, significant species including threatened species and endangered ecological;communities;;2. Map the location of vegetation communities and any significant species or isolated weed infestations and;prepare this information as spatial data layers;;3. Identify known cultural associations with flora species and vegetation communities;;4. Identify key management issues impacting on vegetation communities within the WCL;;5. Prepare a report of the results
Status	Completed
Spatial representation	
Type	vector

Spatial reference system

Code identifying the spatial reference system 4283

Equivalent scale 1:None

Lineage The vegetation mapping process began with a preliminary interpretation of digital orthorectified aerial photographs (API: images supplied by Lands & Property Information LPI: 2007), extracting out observable structural differences in the vegetation (eg: swamp forests, heathlands, etc) and constructing structural polygons. Following this, community-coded RDP data was used to generate a raw community layer in Manifold  GIS, using the Voronoi algorithm to extrapolate data across the landscape, but constrained by structural API boundaries. Within Mapinfo  GIS, this linework was then overlaid onto digital orthorectified aerial photographs, and each polygon edited where necessary. Subsequent to this, additional interpretation of the areas was undertaken on-screen to highlight potentially different areas of vegetation for later groundtruthing. At all times in the vegetation mapping process, reference was made to the data collected during the RDP phase to confirm specific vegetation units. In some cases, perimeters of certain vegetation types were walked to further refine the map.
